### Game Theory With Engineering Applications

Engineering systems emphasize the potential of control and games beyond traditional applications. Game theory can be used to design incentives to obtain socially desirable behaviors on the part of the players, for example, a change in the consumption patterns on the part of the "prosumers"(producers-consumers) or better redistribution of traffic.

This course is an introduction to the fundamentals of game theory and mechanism design. Motivations are drawn from engineered/networked systems (including distributed control of wireline and wireless communication networks, incentive-compatible/dynamic resource allocation, multi-agent systems, pricing and investment decisions in the Internet), and social models (including social and economic networks).

Game Theory is a branch of mathematics that using scenario design and analysis attempts to predict the behaviors and decision outcomes of the parties, called players, who have the right to make decisions in interaction with each other. Rock-paper-scissors hand game is a well-known example of this type of interactive game (multiple actors, multiple rules, choices and specific outcomes for each situation).

Large-scale networks emerged from interconnections of smaller networks and their operation relies on various degrees of competition and cooperation.

Game Theory: Lecture 15 Introduction Repeated Games In many strategic situations, players interact repeatedly over time. Perhaps repetition of the same game might foster cooperation. By repeated games, we refer to a situation in which the same stage game (strategic form game) is played at each date for some duration of T periods.
